Did you know…

In the United States alone, there are over 72.8 million dogs. Collectively, 30,000 tons of waste are produced daily; totaling 10 million tons of waste per year!

How is pet waste harmful?

Waste from your pet contains fecal coliform bacteria such as Salmonella and E. coli. Water that contacts waste before entering the ground from storms, snowmelt, and irrigation systems can bring these bacteria into the water we drink. Animals, humans, and objects may also contact these bacteria in areas where waste is left on the ground.

Runoff that enters the wastewater system can also carry pet waste into local watersheds. When pet waste is decomposed, oxygen is removed from the water and harms aquatic life.

What can you do to help?

- Be prepared. Bring one or two bags with you when you walk your pet or take your pet to a park. Bagged waste should be placed in the trash. If there is no refuse container to deposit the waste in, tie the bag to the leash and dispose when the next opportunity arrives.

- Be Responsible. Dispose of your pet’s waste from your yard in a timely manner. Pet waste should never be composted or used as fertilizer. Never dispose of pet waste on streets, sidewalks, or in storm drains.

- Spread the word! Encourage other pet owners to dispose of their pet’s waste responsibly.
